GENERAL INFORMATION

The ICP-10111 pressure sensor family is based on MEMS capacitive technology which provides ultra-low noise at the lowest power, enabling industry leading relative accuracy, sensor throughput, and temperature stability. The pressure sensor can measure pressure differences with an accuracy of ±1 Pa, enabling altitude measurement differentials as small as 8.5 cm, less than the height of a single stair step.

Consuming only 1.3 µA @1 Hz, available in footprint of 2 mm x 2.5 mm x 0.92 mm, the ICP-10111 is ideally suited for mobile phones, wearable fitness monitoring, drones, and battery powered IoT.

The ICP-10111 offers an industry leading temperature coefficient offset of ±0.5 Pa/°C. The combination of high accuracy, low power, temperature stability, waterproofing in a small footprint enables higher performance barometric pressure sensing for sports activity identification, mobile indoor/outdoor navigation, and altitude-hold in drones.

Denotes RoHS and Green-Compliant Package

APPLICATIONS

- Altitude Control of Drones and Flying Toys
- Mobile Phones
- Virtual Reality and Gaming Equipment
- Indoor/Outdoor Navigation (dead-reckoning, floor/elevator/step detection)
- Vertical velocity monitoring
- Leisure, Sports, and Fitness Activity Identification
- Weather Forecasting

FEATURES

- Pressure operating range: 30 to 110 kPa
- Noise and current consumption
  - 0.4 Pa @ 10.4 µA (ULN mode)
  - 0.8 Pa @ 5.2 µA (LN mode)
  - 3.2 Pa @ 1.3 µA (LP mode)
- Pressure Sensor Relative Accuracy: ±1 Pa for any 10 hPa change over 950 hPa-1050 hPa at 25°C
- Pressure Sensor Absolute Accuracy: ±1 hPa over 950 hPa-1050 hPa, 0°C to 65°C
- Pressure Sensor Temperature Coefficient Offset: ±0.5 Pa/°C over 25°C to 45°C at 100 kPa
- Temperature Sensor Absolute Accuracy: ±0.4°C
- Temperature operating range: -40 °C to 85 °C
- Host Interface: I²C at up to 400 kHz
- Single Supply voltage: 1.8V ±5%
- RoHS and Green compliant

1 INTRODUCTION

1.1 PURPOSE AND SCOPE

This document is a preliminary product specification, providing a description, specifications, and design related information for the ICP-10111 Pressure Sensor.

Specifications are subject to change without notice. Final specifications will be updated based upon characterization of production silicon.

1.2 PRODUCT OVERVIEW

The ICP-10111 is an ultra-low power, low noise, digital output barometric pressure and temperature sensor IC. It is based on an innovative MEMS capacitive pressure sensor technology that can measure pressure differences with an accuracy of ±1 Pa at the industry's lowest power. The high accuracy MEMS capacitive pressure sensor is capable of measuring altitude differentials down to 8.5 cm without the penalty of increased power consumption or reduced sensor throughput.

The capacitive pressure sensor has a ±1 hPa absolute accuracy over its full range of 300 hPa - 1100 hPa. The pressure sensor has an embedded temperature sensor and 400 kHz I²C bus for communication. For power-critical applications, the ICP-10111 features a low power mode of 1.3 µA at a noise of 3.2 Pa or for high performance applications, it features a low noise mode of 0.8 Pa while only consuming 5.2 µA.

The ICP-10111 also offers industry leading temperature stability of the pressure sensor with a temperature coefficient offset of ±0.5 Pa/°C. The high accuracy, temperature stability, and market leading low power consumption of 1.3 µA @1 Hz offered by ICP-10111 makes it ideally suited for applications such as mobile phones, drone flight control and stabilization, indoor/outdoor navigation (elevator, floor, and stair step detection), sports and fitness activity monitoring, and battery-powered IoT.
2 PRESSURE AND TEMPERATURE SENSOR SPECIFICATIONS

2.1 OPERATION RANGES

The sensor shows best performance when operated within the recommended temperature and pressure range (hereafter called normal conditions) of 0°C – 45°C and 95 kPa – 105 kPa, respectively. The following ranges are defined for the device:

<table>
<thead>
<tr>
<th>OPERATION RANGE</th>
<th>PRESSURE (KPA)</th>
<th>TEMPERATURE (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>95 to 105</td>
<td>0 to 45</td>
</tr>
<tr>
<td>Extended</td>
<td>30 to 110</td>
<td>-20 to 65</td>
</tr>
<tr>
<td>Maximum</td>
<td>25 to 115</td>
<td>-40 to 85</td>
</tr>
</tbody>
</table>

Table 1. Operation Ranges

2.2 OPERATION MODES

The sensor can be operated in up to four different measurement modes to satisfy different requirements for power consumption vs. noise, accuracy and measurement frequency. An overview of the operation modes is given in Table 2.

<table>

Table 2. Operation Modes

Notes:

1. Guaranteed by design.

Low Power modes supports ODR greater than 500 Hz while the Low Noise mode provides industry leading RMS noise at a fast 40 Hz ODR. Further decrease in noise may be achieved by software oversampling and filtering through customer’s software implementation or custom TDK-InvenSense operation modes available upon request.
2.3 PRESSURE SENSOR SPECIFICATIONS

Pressure sensor specifications are given in Table 3. Default conditions of 25 °C and 1.8V supply voltage apply, unless otherwise stated.

Table 3. Pressure Sensor Specifications

Notes:
1. Absolute accuracy may be improved through One Point Calibration.
2. Sensor accuracy post Solder reflow may be improved through One Point Calibration.
3. Parameter specifications shown are component-level. They may be different at the board-level and may depend on PCB characteristics including but not limited to PCB material, number of layers, PCB thickness. They may also depend on usage conditions.
4. Specification value is based on PCBs with no solder mask under the device. Specification value may depend on PCB characteristics including but not limited to PCB material, number of layers, PCB thickness. It may also depend on usage conditions.

2.4 TEMPERATURE SENSOR SPECIFICATIONS

Specifications of the temperature sensor are shown in Table 4.

</tbody>
</table>

Table 4. Temperature Sensor Specifications

2.5 RECOMMENDED OPERATION CONDITIONS

The pressure sensor exhibits best performance when operated within the normal pressure and temperature range 0°C < T < 45°C and 95 kPa < P < 105 kPa.

 Injected photo current due to strong light sources can influence the sensor performance and should be avoided to guarantee best operation.

The sensor should not be exposed to high mechanical stress, the resulting deformation of the package can alter internal dimensions and therefore falsify the sensor signal. Solder reflow may affect device performance. One-point calibration can improve the sensor accuracy post solder reflow.

---

**Figure 2. Pin Out Diagram for ICP-10111 2 mm x 2.5 mm x 0.92 mm LGA**
4.3 TYPICAL OPERATING CIRCUIT

Power supply pins supply voltage (Vdd) and ground (Vss) must be decoupled with a 100 nF capacitor that shall be placed as close to the sensor as possible (see Figure 4).

SCL is used to synchronize the communication between the microcontroller and the sensor. The master must keep the clock frequency within 0 to 400 kHz as specified in Table 8.

The SDA pin is used to transfer data in and out of the sensor. For safe communication, the timing specifications defined in the I2C manual must be met.

To avoid signal contention, the microcontroller must only drive SDA and SCL low. External pull-up resistors (i.e. 10 kΩ) are required to pull the signal high. For dimensioning resistor sizes, user should also consider bus capacity requirements. It should be noted that pull-up resistors may be included in I/O circuits of microcontrollers.
User should refer to AN-000140 “TDK-InvenSense Pressure Sensor PCB Design Guidelines” for PCB guidelines and sensor integration.

</tbody>
</table>

Table 11. ICP-10111 I²C Device Address

5.1 POWER-UP AND COMMUNICATION START

Upon VDD reaching the power-up voltage level V_POR, the ICP-10111 enters idle state after a duration of t_PU. In idle state, the ICP-10111 is ready to receive commands from the master (microcontroller).

Each transmission sequence begins with START condition (S) and ends with an (optional) STOP condition (P) as described in the I²C-bus specification. Whenever the sensor is powered up, but not performing a measurement or communicating, it automatically enters idle state for energy saving.

5.2 MEASUREMENT COMMANDS

The ICP-10111 provides the possibility to define the sensor behavior during measurement as well as the transmission sequence of measurement results. These characteristics are defined by the appropriate measurement command.

Each measurement command triggers both a temperature and a pressure measurement.

Table 12. Measurement Commands

5.3 STARTING A MEASUREMENT

A measurement communication sequence consists of a START condition followed by the I²C header with the 7-bit I²C device address and a write bit (write W: ‘0’, 8-bit word including I²C header: 0xC6). The sensor indicates the proper reception of a byte by pulling the SDA pin low (ACK bit) after the falling edge of the 8th SCL clock. Then the sensor is ready to receive a 16-bit measurement command. Again, the ICP-10111 acknowledges the proper reception of each byte with ACK condition. A complete measurement cycle is presented in Figure 5.

With the acknowledgement of the measurement command, the ICP-10111 starts measuring pressure and temperature.

5.4 SENSOR BEHAVIOR DURING MEASUREMENT

In general, the sensor does not respond to any I²C activity during measurement, i.e. I²C read and write headers are not acknowledged (NACK).

5.5 READOUT OF MEASUREMENT RESULTS

After a measurement command has been issued and the sensor has completed the measurement, the master can read the measurement results by sending a START condition followed by an I²C read header (8-bit word including I²C header: 0xC7). The sensor will acknowledge the reception of the read header and send the measured data in the specified order to the master. The MSB of the corresponding data is always transmitted first. Temperature data is transmitted in two 8-bit words and pressure data is transmitted in four 8-bit words. Regarding the pressure data, only the first three words MMSB, MLSB and LMSB contain information about the ADC pressure value \( p_{dout} \). Therefore, for retrieving the ADC pressure value, LLB must be disregarded:

\[ p_{dout} = \text{MMSB} \ll 16 | \text{MLS} \ll 8 | \text{LMSB}. \]
Two bytes of data are always followed by one byte CRC checksum, for calculation see section 5.8. Each byte must be acknowledged by the microcontroller with an ACK condition for the sensor to continue sending data. If the ICP-10111 does not receive an ACK from the master after any byte of data, it will not continue sending data.

Whether the sensor sends out pressure or temperature data first depends on the measurement command that was sent to the sensor to initiate the measurement (see Table 12).

The I²C master can abort the read transfer with a NACK condition after any data byte if it is not interested in subsequent data, e.g. the CRC byte or the second measurement result, to save time.

### 5.6 SOFT RESET

The ICP-10111 provides a soft reset mechanism that forces the system into a well-defined state without removing the power supply. If the system is in idle state (i.e. if no measurement is in progress) the soft reset command will be accepted by ICP-10111. This triggers the sensor to reset all internal state machines and reload calibration data from the memory.

<table>
<thead>
<tr>
<th>COMMAND</th>
<th>HEXADECIMAL CODE</th>
<th>BINARY CODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soft reset</td>
<td>0x805D</td>
<td>1000'0000'0101'1101</td>
</tr>
</tbody>
</table>

Table 13. Soft Reset Command

### 5.7 READ-OUT OF ID REGISTER

The ICP-10111 has an ID register which contains a specific product code. The read-out of the ID register can be used to verify the presence of the sensor and proper communication. The command to read the ID register is shown in Table 14.

<table>
<thead>
<tr>
<th>COMMAND</th>
<th>HEXADECIMAL CODE</th>
<th>BINARY CODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read ID register</td>
<td>0xEFC8</td>
<td>1110'1111'1100'1000</td>
</tr>
</tbody>
</table>

Table 14. Read-Out Command of ID Register

It needs to be sent to the ICP-10111 after an I²C write header. After the ICP-10111 has acknowledged the proper reception of the command, the master can send an I²C read header and the ICP-10111 will submit the 16-bit ID followed by 8 bits of CRC. The structure of the ID is described in Table 15. Bits 15:6 of the ID contain unspecified information (marked as “x”), which may vary from sensor to sensor, while bits 5:0 contain the ICP-10111 specific product code.

<table>
<thead>
<tr>
<th>16-bit ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxx'xxxx'xx 00'1000</td>
</tr>
<tr>
<td>bits 5 to 0: ICP-10111-specific product code</td>
</tr>
<tr>
<td>bits 15 to 6: unspecified information</td>
</tr>
</tbody>
</table>

Table 15. 16-bit ID Structure

### 5.8 CHECKSUM CALCULATION

The 8-bit CRC checksum transmitted after each data word is generated by a CRC algorithm with the properties displayed in Table 16. The CRC covers the contents of the two previously transmitted data bytes.
### 5.9 CONVERSION OF SIGNAL OUTPUT

Pressure measurement data is always transferred as 4 8-bit words; temperature measurement data is always transferred as two 8-bit words. Please see section 5.5 for more details.

Temperature measurement values \( t_{\text{dout}} \) are linearized by the ICP-10111 and must be calculated to °C by the user via the following formula:

\[
T = -45^\circ \text{C} + \frac{175^\circ \text{C}}{2^{16}} \times t_{\text{dout}}.
\]

For retrieving physical pressure values in Pa the following conversion formula has to be used:

\[
P = A + \frac{B}{C + p_{\text{dout}}},
\]

where \( p_{\text{dout}} \) is the sensor’s raw pressure output. The converted output is compensated for temperature effects via the temperature dependent functions \( A, B \) and \( C \). Besides the raw temperature output \( t_{\text{dout}} \), the calculation of \( A, B \) and \( C \) requires to access calibration parameters OTP0, OTP1, OTP2, OTP3 stored in the OTP of the sensor. Read-out of OTP parameters is described in section 5.10.

Full sample code for calculating physical pressure values is given in section 5.11. The general workflow of the conversion is done by:

1) Import class \texttt{Invensense\_pressure\_conversion}

2) Read out values OTP0, ..., OTP3 and save to \( c1, ..., c4 \)

3) Create object \texttt{name} for an individual sensor with parameter values \( c1, ..., c4 \)
   \[
   \text{Name} = \text{Invensense\_pressure\_conversion}(\{c1,c2,c3,c4\})
   \]

4) Get raw pressure \( p_{\text{dout}} \) and temperature \( t_{\text{dout}} \) data from the sensor as described in chapter 5.5.

5) Call function get\_pressure:
   \[
   \text{Name}\_\text{get\_pressure}(p_{\text{dout}}, t_{\text{dout}})
   \]

The sample code from section 5.13 gives an example of this workflow.
5.10 READ-OUT OF CALIBRATION PARAMETERS

For converting raw pressure data to physical values, four calibration parameters have to be retrieved from the OTP of the sensor.

**Set up of OTP read:**

1) Send I²C write header 0xC6
2) Send command 0xC595 (move pointer in address register)
3) Send address parameter together with its CRC 0x00669C

Steps 1) – 3) can be executed on many platforms by a single I²C write of the value 0xC59500669C.

**Read out parameters:**

Repeat the following procedure 4 times:

a) Send I²C write header 0xC6
b) Send command 0xC7F7 (incremental read-out of OTP)
c) Send I²C read header 0xC7
d) Read 3B (2B of data and 1B of CRC)
e) Decode data as 16bit big endian signed integer and store result into n-th calibration parameter cn.

Steps a) to d) can be executed on many platforms by a single write 0xC7F7 to the chip address followed by a single read of 3 B from the chip address.

5.11 SAMPLE CODE: EXAMPLE C SYNTAX

```c
/* data structure to hold pressure sensor related parameters */

6 **ASSEMBLY**

This section provides general guidelines for assembling TDK-InvenSense Micro Electro-Mechanical Systems (MEMS) pressure sensors.

6.1 **IMPLEMENTATION AND USAGE RECOMMENDATIONS**

**Soldering**

When soldering, use the standard soldering profile IPC/JEDEC J-STD-020 with peak temperatures of 260°C. ICP-10111 may exhibit a pressure offset after soldering, some settling time may be required depending on soldering properties, PCB properties, and ambient conditions.

The ICP-10111 is an open cavity package, it is mandatory to use no-clean solder paste and no board wash should be applied.

**Chemical Exposure and Sensor Protection**

The ICP-10111 is an open cavity package, and should not be exposed to particulates or liquids. If any type of protective coating must be applied to the circuit board, the sensor must be protected during the coating process.
